1. EXECUTIVE SUMMARY

Exvul Web3 Security was engaged by FILX TOKEN to review smart contract implementation. The assessment was conducted in accordance with our systematic approach to evaluate potential security issues based upon customer requirement. The report provides detailed recommendations to resolve the issue and provide additional suggestions or recommendations for improvement.

Informational risk finding is primarily related to the validation.

The outcome of the assessment outlined in chapter 3 provides the system's owners a full description of the vulnerabilities identified, the associated risk rating for each vulnerability, and detailed recommendations that will resolve the underlying technical issue.

1.1 Methodology

To standardize the evaluation, we define the following terminology based on OWASP Risk Rating Methodology [10] which is the gold standard in risk assessment using the following risk models:

- Likelihood: represents how likely a particular vulnerability is to be uncovered and exploited in the wild.
- Impact: measures the technical loss and business damage of a successful attack.
- Severity: determine the overall criticality of the risk.

Likelihood can be: High, Medium and Low and impact are categorized into for: High, Medium, Low, Informational. Severity is determined by likelihood and impact and can be classified into five categories accordingly, Critical, High, Medium, Low, Informational shown in table 1.1.

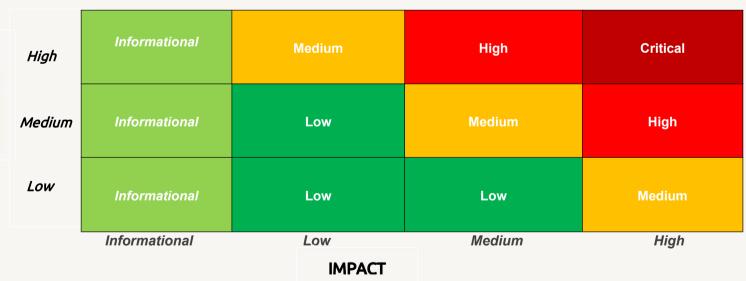

Table 1.1 Overall Risk Severity

To evaluate the risk, we will be going through a list of items, and each would be labelled with a severity category. The audit was performed with a systematic approach guided by a comprehensive assessment list carefully designed to identify known and impactful security issues. If our tool or analysis does not identify any issue, the contract can be considered safe regarding the assessed item. For any discovered issue, we might further deploy contracts on our private test environment

and run tests to confirm the findings. If necessary, we would additionally build a PoC to demonstrate the possibility of exploitation. The concrete list of check items is shown in Table 1.2.

- Basic Coding Bugs: We first statically analyze given smart contracts with our proprietary static code analyzer for known coding bugs, and then manually verify (reject or confirm) all the issues found by our tool.
- Code and business security testing: We further review business logics, examine system operations, and place DeFi-related aspects under scrutiny to uncover possible pitfalls and/or bugs.
- Additional Recommendations: We also provide additional suggestions regarding the coding and development of smart contracts from the perspective of proven programming practices.

Category	Assessment Item		
	Apply Verification Control		
	Authorization Access Control		
	Forged Transfer Vulnerability		
	Forged Transfer Notification		
	Numeric Overflow		
Pagia Codina Assassment	Transaction Rollback Attack		
Basic Coding Assessment	Transaction Block Stuffing Attack		
	Soft Fail Attack		
	Hard Fail Attack		
	Abnormal Memo		
	Abnormal Resource Consumption		
	Secure Random Number		
	Asset Security		
	Cryptography Security		
	Business Logic Review		
	Source Code Functional Verification		
Advanced Course Code Casulinu	Account Authorization Control		
Advanced Source Code Scrutiny	Sensitive Information Disclosure		
	Circuit Breaker		
	Blacklist Control		
	System API Call Analysis		
	Contract Deployment Consistency Check		
Additional Recommendations	Semantic Consistency Checks		

Category	Assessment Item	
	Following Other Best Practices	

Table 1.2: The Full List of Assessment Items

To better describe each issue we identified, we categorize the findings with Common Weakness Enumeration (CWE-699) [14], which is a community-developed list of software weakness types to better delineate and organize weaknesses around concepts frequently encountered in software development.

2. FINDINGS OVERVIEW

2.1 Project Info And Contract Address

Project Name: FILX TOKEN

Project address:

https://etherscan.io/address/0x7D0ce6F744ebfE2Ea039b9a9A77D5c3075F275b9#code

Audit Time: April18th, 2024 - April19th, 2024

Language: solidity

2.2 Summary

Severity	Found
Critical	0
High	0
Medium	0
Low	0
Informational	1

2.3 Key Findings

High risk finding is primarily related to pair address takeover. Informational risk finding is primarily related to the mulsig.

ID	Severity	Findings Title	Status	Confirm
NVE- 001	Informational	Constructor mint should have zero address check	Ignored	Confirmed

Table 2.1: Key Audit Findings

3. DETAILED DESCRIPTION OF FINDINGS

3.1 Constructor mint should have zero address check

ID:	NVE-001	Location:	FILX.sol
Severity:	Info	Category:	Business Issues
Likelihood:	Info	Impact:	Info

Description:

As is shown below, FILX constructor mint to don't have 0 address check, if to address is zero address, total FILX token will be locked.

```
contract FILX is ERC20, ERC20Burnable {
    constructor(address to, uint256 amount)ERC20("FILX", "FILX")
    {
        _mint(to, amount);
    }
}
```

Figure 3.1.1 FLIX.sol

Recommendations:

ExVul Web3 Labs recommends use add zero address check when deploy new FILX token.

Result: Confirmed

4. CONCLUSION

In this audit, we thoroughly analyzed FILX TOKEN smart contract implementation. The problems found are described and explained in detail in Section 3. The problems found in the audit have been communicated to the project leader. We therefore consider the audit result to be PASSED. To improve this report, we greatly appreciate any constructive feedbacks or suggestions, on our methodology, audit findings, or potential gaps in scope/coverage.

5. APPENDIX

5.1 Basic Coding Assessment

5.1.1 Apply Verification Control

Description: The security of apply verification

Result: Not foundSeverity: Critical

5.1.2 Authorization Access Control

Description: Permission checks for external integral functions

Result: Not foundSeverity: Critical

5.1.3 Forged Transfer Vulnerability

 Description: Assess whether there is a forged transfer notification vulnerability in the contract

Result: Not foundSeverity: Critical

5.1.4 Transaction Rollback Attack

• Description: Assess whether there is transaction rollback attack vulnerability in the contract.

Result: Not found

Severity: Critical

5.1.5 Transaction Block Stuffing Attack

Description: Assess whether there is transaction blocking attack vulnerability.

Result: Not found

Severity: Critical

5.1.6 Soft Fail Attack Assessment

Description: Assess whether there is soft fail attack vulnerability.

Result: Not found

Severity: Critical

5.1.7 Hard Fail Attack Assessment

Description: Examine for hard fail attack vulnerability

Result: Not found

Severity: Critical

5.1.8 Abnormal Memo Assessment

• Description: Assess whether there is abnormal memo vulnerability in the contract.

• Result: Not found

• Severity: Critical

5.1.9 Abnormal Resource Consumption

Description: Examine whether abnormal resource consumption in contract processing.

• Result: Not found

Severity: Critical

5.1.10 Random Number Security

• Description: Examine whether the code uses insecure random number.

Result: Not found

• Severity: Critical

5.2 Advanced Code Scrutiny

5.2.1 Cryptography Security

Description: Examine for weakness in cryptograph implementation.

• Results: Not Found

Severity: High

5.2.2 Account Permission Control

Description: Examine permission control issue in the contract

Results: Not Found

Severity: Medium

5.2.3 Malicious Code Behavior

Description: Examine whether sensitive behavior present in the code

Results: Not found

• Severity: Medium

5.2.4 Sensitive Information Disclosure

• Description: Examine whether sensitive information disclosure issue present in the code.

Result: Not found

Severity: Medium

5.2.5 System API

• Description: Examine whether system API application issue present in the code

• Results: Not found

• Severity: Low

6. DISCLAIMER

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to the Company in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes without ExVul's prior written consent.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts ExVul to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. ExVul's position is that each company and individual are responsible for their own due diligence and continuous security. ExVul's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.
